

2D Interactive Project

I LIKE THIS A LOT

Two Ideas: ① Static City

- Cityscape
- L.A. esque
- Allow Looking Around
- Allow Time Control
 - Shift Color Palette
 - Shift Sun position
 - Maybe windows Lights
- Simple, should cover all bases

② 2D Platformer

- Simple Platformer
- One Jump
- Simple Combat
 - NOT MARIO
 - Dead Cells esque?
- Zelda I Inventory
- Roguelike
 - One death
 - NO save
- Reuse Terminal Lore?
- Simple Continue Code Systems
- Again Complex
- Health, Armour?
- Stamina

- Simple weapons
- Simple shapes
- Possible splash?

NO!!
Text class is Aulb.

windows
should shift
Color Palette
grey at day
yellow at Night

Overdraw? offset for movement

Clouds and Sun Should Physically Move and Shift Colors when time passes

A -> Reverse Time

B -> Forward Time

Passive Time flow?

Keep buildings in an array set at center
Separate array for window of screen

mx, my
 $s.w/2, s.h/2$ gx, gy
offset graphics based on mouse pos

Implement First

② Falling shooter game

- Inner Squares expand to create movement Illusion
- Character animated slightly
- Possible Audio? - Focus after finish
- Player falls and spins to shoot targets

1. Rectangles are platforms for enemies
2. Colored expanding squares for Illusion - do first
3. Player is static? Rotate whole Illusion?
 - Smooth Rotation may not be possible:
 - It so, Allow player to switch direction and move

Simple First, Complex Later

If position != to either Min or Max
 Allow movement
 else
 Prohibit movement

Pivoting Directions

- Having trouble Implementing background Smoothly
- Player Input is already written.
- Player Collision written

Falling game

$Rect = Vector4(x, y, size, color)$ / Color is 0, 1, 2, 3, 4
do ~~and~~ If check for Color
Selection. e.g. 0 = Custom Red, etc.

Time dependencies

$Rect Vector4(centre, RectSize, Color)$
 $RectSize += Time.DeltaTime * RectSpeed(\text{for tuning})$
Rect Color should go from dim to bright
and slightly change Color
Maybe Make a master Time var / $Time.DeltaTime * \text{Scalar}$

Characters should have
the ability to attack,
and HP Count

Sprite concept

Brandon Callaway
Game Dev. #2
Falling Shooter Idea

This was my original Idea,
however the screen-tear was
Really bad - BC

Store screen center, Copy value to another var and offset
based on W, A, S, D Input // Nah, player can move instead

Center = window.Width/2, window.Height/2
1. Spawn Squares at the center of Screen
Stick with 600x600 or 400x400.

Pixel Paper - 100 x 100
Graph Paper for Screen Coordinates

Seconds elapsed

Spawn Random
2x2 squares of
slightly varied
colors to add
Texture to walls

↳ Three Calls for three walls
All in draw background

I have the range
that the squares
can spawn on a given
Square, Random spawn within

↑
Having this in update is an
EPSO, Populate array once

Pixel Paper - 100 x 100
Graph Paper for Screen Coordinates

Player Position and window Collision

$\geq$ $\leq$ ~~not~~
 Top Left Top Right
 $[60, 0] - [70, 0]$ If $SX \geq X$ & $SX \leq YM$
 $[60, 10] - [70, 10]$ HAHA!!
 Bottom Left Bottom Right
 $[X, Y] \rightarrow [X+S, Y]$ This works!

If pos.X
 is greater
 than 0:
 Allow
 movement

If pos.Y
 is less than
 window height
 - player
 size
 Allow
 movement

player would
 be rendered
 out of window

Since player
 origin is 0,0
 offset rectangle
 by half of player
 size

Added
 offset to collision
 check, Allows Limiting
 player movement

Sprite Sheet

0 Boss Ideas 10 20 30 40 50 60 70 80 90 100

← Not Center

wretch Empty wizard Death Warrior
Only Arms and slightly

Pixel Paper - 100 x 100
Graph Paper for Screen Coordinates

Player Skin = 207, 185, 151

$$\text{PlayerCollBox} = [\overset{0}{x}, \overset{1}{y}], [\overset{0}{xs}, \overset{1}{ys}]$$

EDIT: So this Δ If $x = 10, y = 15, \text{size} = 5$
technically works Δ
for ONE point, $(10, 15) \leftrightarrow (15, 15)$
update for 4 Δ $(10, 20) \leftrightarrow (15, 20)$

-Realized I can't read the boxes
Square comes one piece
